

Cardiorespiratory Rehabilitation

Monitored pacing, robust recovery. Telemetry-monitored cardiac and respiratory rehabilitation to rebuild lung capacity, stamina, and heart safety post-surgery.

INTERACTIVE RECOVERY PROTOCOL

DAYS 1 - 5: ACUTE RECONDITIONING

Regulated deep breathing re-education, monitored incentive spirometry, gentle non-weight-bearing mobility, and telemetry-guided transfers.

DAYS 6 - 15: STAMINA & AEROBIC LIFT

Monitored telemetry corridor walking, step-up simulations, functional endurance exercises (1-3 MET target), and splinted chest protection drills.

WEEKS 3 - 4: ACTIVE SELF-MANAGEMENT

Mastering home energy-conservation pacing, independent vital logging (RPE scale, pulse oximetry), and complete functional walking independence.

EXPECTATIONS

> Telemetry Pacing

Continuous monitoring of SpO2, heart rates, and blood pressure dynamics.

> Sternal Protection

Sternal pillow compression splinting, safe log-rolling, and arm shear prevention.

> Airway Clearance

Diaphragmatic breathing, posture drainage, and chest vibration clears.

> Vital Devices

Incentive spirometers, pulse oximeters, and sternal splint pillows.

VERIFY ADMISSION ELIGIBILITY

Review bypass/angioplasty logs, coordinate secure step-down transfers, and secure your cardiorespiratory recovery suite.
